INTRODUCTION

The Nova Scotia Formulary details which drugs and supplies are benefits under the Nova Scotia Seniors' Pharmacare Program, Family Pharmacare Program, Diabetes Assistance Program, Community Services Pharmacare Programs and Drug Assistance for Cancer Patients.

The Formulary is provided on our website at www.nspharmacare.ca in PDF.

The ATC Classification System

All medications are classified according to the Anatomical Therapeutic Chemical (ATC) Classification System which is used by the World Health Organization for pharmacoepidemiological purposes and by the Patented Medicine Prices Review Board for pricing purposes.

The ATC Classification System groups chemically similar products according to their site of action and facilitates the comparison of new medicines with previously available medicines. There are fourteen main groups in the ATC system:

- A Alimentary tract and metabolism
- B Blood and blood forming organs
- C Cardiovascular system
- D Dermatologicals
- G Genito-urinary system and sex hormones
- H Systemic hormonal preparations, excluding sex hormones
- J General antiinfectives, systemic
- L Antineoplastic and immunomodulating agents
- M Musculo-skeletal system
- N Nervous system
- P Antiparasitic products, insecticides and repellents
- R Respiratory system
- S Sensory organs
- V Various

Each group is subdivided into anatomical, therapeutic and chemical subgroups as shown in the Legend.

A drug may be given more than one ATC code. If it is available in two or more strengths or formulations with clearly different therapeutic uses, the drug would appear in various categories depending on its different forms. If a drug has more than one clinical indication, the main indication is chosen for the listing of the various brands and strengths of this drug.

Interchangeability, Maximum Reimbursable Price (MRP) and Pharmacare Reimbursement Price (PRP)

The Formulary indicates those products which have been deemed interchangeable by the Drugs and Therapeutics Committee of the Nova Scotia Department of Health and Wellness (see the Legend). For generic products that meet the criteria for interchangeability a Maximum Reimbursable Price (MRP) may be applied. MRP is the maximum price established by the Pharmacare Programs for an interchangeable generic drug. MRP is applied to those drugs which are Pharmacare benefits, and have been deemed interchangeable (e.g., brand name drugs and their generic equivalents) The MRP is the maximum amount that the Pharmacare Programs will reimburse providers for one unit (tablet, capsule, millilitre, etc.) of a drug.

For each interchangeable, generic drug category, a maximum reimbursable price per unit (e.g., tablet, capsule, millilitre) is determined by calculating a percentage of the cost of the equivalent brand name drug. The percentage of the MRP is reimbursed at **25%** of the cost of the manufacturer list price of the equivalent brand drug.

Some generic drugs may have exceptions to the MRP formula, and their MRP will also be included in the Reimbursement List. Exemptions to the MRP are available for beneficiaries who have experienced a severe or life threatening reaction with lower cost alternatives. A request must be received from the prescriber detailing the reaction.

Providers shall not charge any cost difference between the MRP of the drug and amount reimbursed by the Pharmacare Programs unless the beneficiary requests the higher priced drug. If the beneficiary requests the higher priced drug the extra cost is not counted toward their annual maximum copayment or annual maximum deductible.

In addition, a Pharmacare Reimbursement Price (PRP) is the maximum cost assigned to:

- certain groups of drugs that are similar in effect;
- specific services for which coverage is established;
- certain unit dose and special delivery formats that are also available in less expensive bulk formats; and
- certain supplies that are used for the same function.

The PRP is the maximum amount the Pharmacare Program reimburses providers for one unit of a drug (tablet, capsule, millilitre, etc.) supply or service.

Providers may charge the beneficiary the portion of their AAC that exceeds the PRP. The extra cost is not counted toward the beneficiary's annual maximum copayment or annual maximum deductible.

In all pricing categories, except AAC, the Pharmacare Programs will reimburse pharmacies the lesser of the amount submitted, or as applicable, MLP, MRP, or PRP.

All Manufacturer List Prices (MLPs) will be updated on a quarterly basis unless otherwise notified directly by the manufacturer.

Prescriber

The Formulary provides prescriber codes (see Legend) associated with each benefit under the Pharmacare Programs. These codes indicate which benefits will be reimbursed when prescribed by a specific prescriber.

The Nova Scotia Government Pharmacare Programs

1. **Seniors' Pharmacare Program** - available to all Nova Scotia seniors 65 years or older who have a valid Nova Scotia Health Card, and do not have private drug coverage.
2. **Community Services Pharmacare Programs** - The Department of Community Services provides drug benefits as part of the Income Assistance Programs (including Special Needs Pharmacare and Transitional Pharmacare), the Low Income Pharmacare Program for Children, Services for Persons with Disabilities and the Children in Care Programs. Eligibility is determined by the Department of Community Services.
3. **Drug Assistance for Cancer Patients**, an income based assistance program covering medication for the treatment of cancer.
4. **Diabetes Assistance Program**, an income based assistance program covering medication and supplies needed for diabetes treatment.
5. **Under 65-Long Term Care (LTC) Pharmacare**, provides drug coverage for long term care residents under 65 years of age who have no drug insurance.
6. **Family Pharmacare Program**, an income based program available to all Nova Scotians with a valid Nova Scotia Health Card who are not currently receiving drug benefits through Seniors', Community Services, Diabetes Assistance or the Under 65-Long Term Care Pharmacare Programs.

The benefit status of medications reimbursed under these programs are indicated, in the fourth column of the ATC classification, by the letters **S** (Seniors' Pharmacare), **F** (Community Services Pharmacare / Under 65-Long Term Care Pharmacare / Family Pharmacare), **C** (Drug Assistance for Cancer Patients), **D** (Diabetes Assistance) or **E** (Exception Status Drug - see Appendix III). If this column is blank, the product is not a benefit under any of these programs.

Miscellaneous Section

Diabetes and ostomy supplies are listed in this section. These products are benefits under the Seniors' and Community Services Pharmacare Programs and are cross-referenced in the appropriate ATC classification. Diabetes supplies are also benefits under the Diabetes Assistance Program.

Appendix III – Criteria for Coverage of Exception Status Drugs

Coverage of exception status drugs will be approved according to the following criteria upon review of a prescriber's written request. Forms for Exception Status Drug request, which may be used to facilitate the approval process can be found at <https://novascotia.ca/dhw/pharmacare/exception-status-drugs.asp>.

As an alternative to sending a written request to the Pharmacare office, certain exception status drugs have been assigned criteria codes. To allow for on-line payment of these drugs, the criteria code may be provided by the prescriber on the prescription or confirmed by the pharmacist. The use of these codes offers the prescriber and the pharmacist access to immediate coverage for patients who clearly meet the exception status criteria. The criteria codes are indicated within the following exception criteria.

ABATACEPT (*Orencia 125mg/mL Prefilled Syringe and 250mg/vial Injection*)

- For the treatment of severely active rheumatoid arthritis, in combination with methotrexate or other disease-modifying antirheumatic drugs (DMARDs), in adult patients who are refractory or intolerant to:
 - Methotrexate (oral or parenteral) at a dose of ≥ 20 mg weekly (≥ 15 mg if patient is ≥ 65 years of age), or use in combination with another DMARD, for a minimum of 12 weeks;
 - AND**
 - Methotrexate in combination with at least two other DMARDs, such as hydroxychloroquine and sulfasalazine, for a minimum of 12 weeks.

Clinical Notes:

- For patients who do not demonstrate a clinical response to oral methotrexate, or who experience gastrointestinal intolerance, a trial of parenteral methotrexate must be considered.
- Optimal treatment response to DMARDs may take up to 24 weeks, however coverage of a biologic therapy can be considered if no improvement is seen after 12 weeks of triple DMARD use.
- If patient factors (e.g. intolerance) prevent the use of triple DMARD therapy, these must be described and dual therapy with DMARDs must be tried.
- Refractory is defined as lack of effect at the recommended doses and for duration of treatments specified above.
- Intolerant is defined as demonstrating serious adverse effects or contraindications to treatments as defined in product monographs. The nature of intolerance(s) must be clearly documented.

Claim Notes:

- Must be prescribed by a rheumatologist.
- Combined use of more than one biologic DMARD will not be reimbursed.
- Initial Approval: 6 months.
- Renewal Approval: 1 year. Confirmation of continued response is required.
- **Maximum Dosage Approved:**
 - Abatacept Intravenous infusion: 500mg for patients <60 kg, 750mg for patients 60-100 kg and 1000mg for patients >100 kg, given at 0, 2, and 4 weeks then every 4 weeks thereafter. Subcutaneous injection: a single IV loading dose of up to 1,000mg may be given, followed by 125mg subcutaneous injection within a day, then once-weekly 125mg subcutaneous injections.
 - Subcutaneous injection: a single IV loading dose of up to 1,000mg may be given, followed by 125mg subcutaneous injection within a day, then once-weekly 125mg subcutaneous injections.

NOTE: Exception status drugs for Drug Assistance for Cancer Patients are indicated by an asterisk (*).

***ABIRATERONE ACETATE (*Zytiga 250mg and 500mg Tablet*)**

ASYMPTOMATIC OR MILDLY SYMPTOMATIC PATIENTS

- In combination with prednisone for asymptomatic or mildly symptomatic metastatic CRPC patients after failure of androgen deprivation therapy (including an LHRH agonist/antagonist or orchiectomy) who have not received prior chemotherapy for metastatic CRPC and have ECOG PS 0 or 1.
- Abiraterone would be an alternative to enzalutamide and not sequential therapy in this asymptomatic or mildly symptomatic patient population.

SYMPOMATIC (POST-DOCETAXEL CHEMOTHERAPY) PATIENTS

- In combination with prednisone for metastatic CRPC patients with ECOG PS of 0-2 and progression after previous treatment with docetaxel.
- Abiraterone would be an alternative to enzalutamide and not sequential therapy in this symptomatic post docetaxel chemotherapy setting.

RETREATMENT

- Use of abiraterone in the post-docetaxel setting is not permitted if previously used in the pre-chemotherapy setting.

ACAMPROSATE (*Campral 333mg Tablet*)

- For treatment in patients who have been abstinent from alcohol for at least four days and who have contraindications to naltrexone (i.e., acute hepatitis, liver failure or currently receiving opioids).

ACLIDINIUM BROMIDE (*Tudorza Genuair 400mcg powder for Inhalation*)

- For the treatment of moderate to severe chronic obstructive pulmonary disease (COPD) as defined by spirometry; OR
- For the treatment of COPD in patients with an inadequate response to short acting bronchodilators.
- Combination therapy with a long-acting beta₂-agonist /inhaled corticosteroid (LABA/ICS) and a long acting anticholinergic (LAAC) inhaler will be considered in patients with: moderate to severe COPD, as defined by spirometry, a history of COPD exacerbation(s) and an inadequate response to LABA/ICS or LAAC.

Clinical Notes:

- Moderate to severe COPD is defined by spirometry as a post bronchodilator FEV1 < 60% predicted and FEV1/FVC ratio of < 0.70. Spirometry reports from any point in time will be accepted.
If spirometry cannot be obtained, reasons must be clearly explained and other evidence of COPD severity provided, i.e., Medical Research Council (MRC) Dyspnea Scale Score of at least Grade 3.
MRC Grade 3 is described as: walks slower than people of same age on the level because of shortness of breath from COPD or has to stop for breath when walking at own pace on the level.
- Inadequate response to short acting bronchodilators is defined as persistent symptoms, i.e., MRC of at least Grade 3, after at least 2 months of short acting bronchodilator at the following doses*:
 - 8 puffs per day of short acting beta₂-agonist; or
 - 12 puffs per day of ipratropium; or
 - 6 puffs per day of ipratropium plus salbutamol combination inhaler.

* Inadequate response to LABA/ICS or LAAC is defined as persistent symptoms after at least 2 months of therapy.

NOTE: Exception status drugs for Drug Assistance for Cancer Patients are indicated by an asterisk (*).

- COPD exacerbation is defined as an increase in symptoms requiring treatment with antibiotics and/or systemic (oral or intravenous) corticosteroids.

Notes:

- Coverage for LABA and LAAC as two separate inhalers will not be considered.
- Inhalers which combine a LABA/LAAC are also available as ESD benefits. These products have their own criteria which are listed in the NS Formulary.

ACLIDINIUM/FORMOTEROL (*Duaklir Genuair 12µg/400µg metered dose for Inhalation*)

- For the treatment of moderate to severe chronic obstructive pulmonary disease (COPD), as defined by spirometry, in patients with an inadequate response to a long-acting beta₂ agonist (LABA) or long-acting anticholinergic (LAAC).

Clinical Notes:

- Moderate to severe COPD is defined by spirometry (post-bronchodilator) FEV1 < 60% predicted and FEV1/FVC ratio of < 0.70. Spirometry reports from any point in time will be accepted.
If spirometry cannot be obtained, reasons must be clearly explained and other evidence regarding COPD severity must be provided for consideration (i.e. Medical Research Council (MRC) Dyspnea Scale score of at least Grade 3). MRC Grade 3 is described as: walks slower than people of same age on the level because of shortness of breath (SOB) from COPD or has to stop for breath when walking at own pace on the level.

APIXABAN (*Eliquis, 2.5mg, 5mg Tablet*)

TOTAL KNEE/HIP REPLACEMENT (ELIQUIS 2.5MG TABLET)

- For the prophylaxis of venous thromboembolism following total knee replacement surgery for up to 14 days, as an alternative to low molecular weight heparins. **[Criteria Code 14]**
- For the prophylaxis of venous thromboembolism following total hip replacement surgery for up to 35 days, as an alternative to low molecular weight heparins. **[Criteria Code 35]**

Notes:

- The total duration of therapy includes the period during which doses are administered post-operatively in an acute care (hospital) setting, and the approval period is for the balance of the total duration after discharge.
- The first dose is typically administered 12 to 24 hours after surgery, assuming adequate hemostasis has been achieved.
- The ADVANCE clinical trial program did not evaluate the efficacy or safety of sequential use of molecular weight heparin followed by apixaban for the prophylaxis of VTE. Due to the current lack of evidence for sequential use, coverage is not intended for this practice.
- Clinical judgment is warranted to assess the increased risk for VTE and/or adverse effects in patients with a history of previous VTE, myocardial infarction, transient ischemic attack or ischemic stroke; a history of intraocular or intracerebral bleeding; a history of gastrointestinal disease with gastrointestinal bleeding; moderate or severe renal insufficiency (estimated creatinine clearance <30 mL/min); severe liver disease; concurrent use of other anticoagulants; or age greater than 75 years.
- Apixaban has not been studied in clinical trials in patients undergoing hip fracture surgery, and is not recommended in these patients.

DEEP VEIN THROMBOSIS/PULMONARY EMBOLISM (ELIQUIS 2.5MG, 5MG TABLET)

- **Inclusion Criteria:**
 - For the treatment of deep vein thrombosis (DVT) or pulmonary embolism (PE)
 - Approval Period: Up to six (6) months

Notes:

- The recommended dose of apixaban for patients initiating DVT or PE treatment is 10mg twice daily for 7 days, followed by 5mg twice daily (for treatment up to 6 months).
- Drug plan coverage for apixaban for the treatment of DVT or PE is an alternative to heparin/warfarin for up to six months. When used for greater than 6 months, apixaban is more costly than heparin/warfarin. As such, patients with an intended duration of therapy greater than 6 months should be considered for initiation on heparin/warfarin.
- Since renal impairment can increase bleeding risk, it is important to monitor renal function regularly. Other factors that increase bleeding risks should also be assessed and monitored (see apixaban product monograph).

****[Criteria Code 32]** will be used to allow the 5mg strength to pay (max 56 tablets), which will allow patients to start therapy while awaiting ESD approval for the six months of therapy.

NOTE: Exception status drugs for Drug Assistance for Cancer Patients are indicated by an asterisk (*).

NON-VALVULAR ATRIAL FIBRILLATION (AF) (ELIQUIS 2.5MG, 5MG TABLET):

- **Inclusion Criteria:**
 - At-risk patients with non-valvular atrial fibrillation (AF) who require apixaban for the prevention of stroke and systemic embolism AND in whom:
 - anticoagulation is inadequate following at least a 2-month trial on warfarin; OR
 - anticoagulation with warfarin is contraindicated or not possible due to inability to regularly monitor via International Normalized Ratio (INR) testing (i.e. no access to INR testing services at a laboratory, clinic, pharmacy, and at home).
- **Exclusion Criteria:**
 - Patients with impaired renal function (creatinine clearance or estimated glomerular filtration rate < 25 mL/min) OR > 75 years of age and without documented stable renal function OR hemodynamically significant rheumatic valvular heart disease, especially mitral stenosis; OR prosthetic heart valves.

Notes:

- At risk patients with non valvular atrial fibrillation are defined as those with a CHADS2 score of ≥ 1. Prescribers may consider an antiplatelet regimen or oral anticoagulation for patients with CHADS2 score of ≥ 1.
- Inadequate anticoagulation is defined as INR testing results that are outside the desired INR range for at least 35% of the tests during the monitoring period (i.e. adequate anticoagulation is defined as INR test results that are within the desired INR range for at least 65% of the tests during the monitoring period).
- Documented stable renal function is defined as creatinine or estimated glomerular filtration rate maintained for at least 3 months.
- Dosing: the usual recommended dose is 5mg twice daily; a reduced dose of apixaban 2.5mg twice daily is recommended for patients with at least two [2] of the following: age > 80 years, body weight < 60kg, or serum creatinine >133 micromole/litre.
- Since renal impairment can increase bleeding risk, renal function should be regularly monitored. Other factors that increase bleeding risk should also be assessed and monitored (see apixaban Product Monograph).
- Patients starting apixaban should have ready access to appropriate medical services to manage a major bleeding event.
- There is currently no data to support that apixaban provides adequate anticoagulation in patients with rheumatic valvular disease or those with prosthetic heart valves. As a result, apixaban is not recommended for these patient populations.

APOMORPHINE (Movapo 30mg/3mL Prefilled Pen)

- For the acute, intermittent treatment of hypomobility “off” episodes (“end-of-dose wearing off” and unpredictable “on/off” episodes) in patients with advanced Parkinson’s disease (PD), if the following criteria are met:
 - Apomorphine should only be used as adjunctive therapy in patients who are receiving optimized PD therapy (levodopa and derivatives and dopaminergic agonists) and still experiencing “off” episodes.

Clinical Notes:

- Patients should be under the care of a physician with experience in the diagnosis and management of PD.
- If the patient is not a good candidate for treatment with dopaminergic agonists, please provide detail as to why (i.e., those with cognitive impairment and impulsivity).

 - aprepitant will not be used in patients receiving moderately emetogenic cancer chemotherapy or radiotherapy;
 - the 5-HT₃ antagonist should only be used on the first day of cisplatin therapy with aprepitant continuing on Day 2 and Day 3.

5. Documented stable renal function is defined as creatinine clearance or estimated glomerular filtration rate that is maintained for at least three months (i.e. 30-49mL/min for 110mg twice daily dosing or ≥ 50 mL/min for 150 mg twice daily dosing).
6. There is currently no data to support that dabigatran provides adequate anticoagulation in patients with rheumatic valvular disease or those with prosthetic heart valves, so dabigatran is not recommended in these populations.

- A reasonable trial on warfarin is defined as at least two months of therapy.
- The usual recommended dose is 60mg once daily. NOTE: Exception status drugs for Drug Assistance for Cancer Patients are indicated by an asterisk (*).

- Recurrent use of nonoccupational postexposure prophylaxis (nPEP) (more than once);
- Ongoing sexual relationship with an HIV-positive partner who is not receiving stable ART and/or does not have an HIV viral load <200 copies/mL. (i.e. not on ART or >200 copies/mL); or
- High-incidence risk index (HIRI)-MSM risk score ≥ 11. Please refer to the [BC-CfE PrEP guidelines](#) or the [Canadian PrEP Guidelines](#) which include details about how to calculate the HIRI-MSM risk score.

HETEROSEXUAL EXPOSURE

- For pre-exposure prophylaxis (PrEP), in combination with safer sex practices, to reduce the risk of sexually acquired HIV-1 infection in heterosexual men and women at high risk of acquiring HIV infection who meet both of the following:
 - Condomless vaginal or anal sex; and
 - Ongoing sexual relationship with an HIV-positive partner who is not receiving stable ART and/or does not have an HIV viral load <200 copies/mL. (i.e. not on ART or >200 copies/mL).

PEOPLE WHO INJECT DRUGS (PWID)

- For pre-exposure prophylaxis (PrEP) for PWID who are at high risk of acquiring HIV infection and meet both of the following:
 - Report sharing of injection equipment; and
 - Have an HIV-positive injecting partner who is not receiving stable ART and/or does not have an HIV viral load < 200 copies/mL.
-

Clinical notes:

- PrEP should be part of a combination prevention strategy that includes behavioural interventions such as condoms and risk reduction counseling.
- PrEP is not recommended in the context of a stable closed relationship with a single partner with no or negligible risk of having transmissible HIV.

Note regarding daily versus “on-demand” dosing:

- As stated in the Canadian Guideline, **daily** emtricitabine/tenofovir disoproxil fumarate (TDF/FTC) is currently the PrEP regimen of choice because it has been the most widely evaluated in high quality studies, and “on-demand” dosing is currently an off-label use of TDF/FTC in Canada. The on-demand regimen requires taking the drug 24 hours before sexual activity, every 24 hours during the sexual activity, and 24 hours after the last sexual encounter. A randomized placebo-controlled trial among MSM in France and Montreal found high efficacy among men who had frequent sex and who regularly took an average of 4 pills per week. These results suggest an on-demand strategy may be less effective for MSM who have less frequent sex because consistent pill use is important to achieve high levels of drugs in the body. A subsequent sub-study found that an on-demand strategy (median 9.5 pills/month) remained highly effective for MSM having infrequent sex (median 5x/month). The implication is that on demand’ PrEP compared with daily, continuous PrEP may decrease the cost of drugs while preventing similar numbers of infections. However, study of how on-demand PrEP would work in “real life” settings outside of a placebo-controlled trial are required.

- **Inclusion Criteria:**

- For the treatment of deep vein thrombosis (DVT) or pulmonary embolism (PE).
- Approval Period: Up to six (6) months.
- [Criteria Code 42] will be used to allow the 15mg strength to pay (max 42 tablets), which will allow patients to start therapy while awaiting ESD approval for the six months of therapy.

Notes:

- The recommended dose of rivaroxaban for patients initiating DVT or PE treatment is 15mg twice daily for 3 weeks, followed by 20mg once daily.
- Drug plan coverage for rivaroxaban is an alternative to heparin/warfarin for up to six months. When used for greater than 6 months, rivaroxaban is more costly than heparin/warfarin. As such, patients with an intended duration of therapy greater than 6 months should be considered for initiation on heparin/warfarin.
- Since renal impairment can increase bleeding risk, it is important to monitor renal function regularly. Other factors that increase bleeding risks should also be assessed and monitored (see rivaroxaban product monograph).

NON-VALVULAR ATRIAL FIBRILLATION

- **Inclusion Criteria:**

- At-risk¹ patients with non-valvular atrial fibrillation (AF) who require rivaroxaban for the prevention of stroke and systemic embolism AND in whom:
 - Anticoagulation is inadequate² following a reasonable trial³ on warfarin; OR
 - Anticoagulation with warfarin is contraindicated or not possible due to inability to regularly monitor via International Normalized Ratio (INR) testing (i.e. no access to INR testing services at a laboratory, clinic, pharmacy, and at home).

- **Exclusion Criteria:**

- Patients with impaired renal function⁴ (creatinine clearance or estimated glomerular filtration rate < 30 mL/min) OR ≥ 75 years of age and without documented stable renal function⁵ OR hemodynamically significant rheumatic valvular heart disease⁶, especially mitral stenosis; OR prosthetic heart valves.

* Please Note: Patients starting rivaroxaban should have ready access to appropriate medical services to manage a major bleeding event.

1. At-risk patients with non-valvular atrial fibrillation are defined as those with a CHADS₂ score of ≥ 1. Although the ROCKET-AF trial included patients with higher CHADS₂ scores (≥ 2), other landmark studies with the other newer oral anticoagulants demonstrated a therapeutic benefit in patients with a CHADS₂ score of 1. Prescribers may consider an antiplatelet regimen or oral anticoagulation for patients with a CHADS₂ score of 1.
2. Inadequate anticoagulation is defined as INR testing results that are outside the desired INR range for at least 35% of the tests during the monitoring period (i.e. adequate anticoagulation is defined as INR test results that are within the desired INR range for at least 65% of the tests during the monitoring period).
3. A reasonable trial on warfarin is defined as at least two months of therapy.
4. Since renal impairment can increase bleeding risk, renal function should be regularly monitored. Other factors that increase bleeding risk should also be assessed and monitored (see Xarelto® (rivaroxaban) Product Monograph).
5. Documented stable renal function is defined as creatinine clearance or estimated glomerular filtration rate of 30-49 mL/min for 15mg once daily dosing or ≥ 50 mL/min for 20mg once daily dosing that is maintained for at least 3 months.
6. There is currently no data to support that rivaroxaban provides adequate anticoagulation in patients with rheumatic valvular disease or those with prosthetic heart valves, so rivaroxaban is not recommended in these populations.
